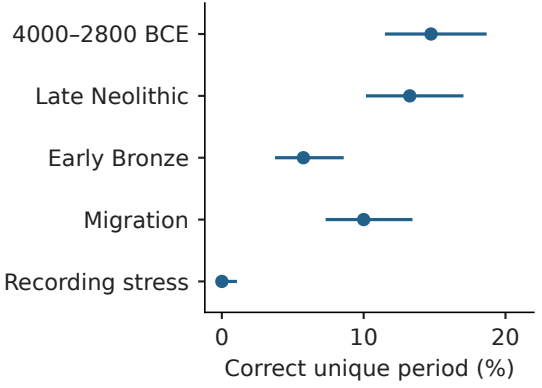
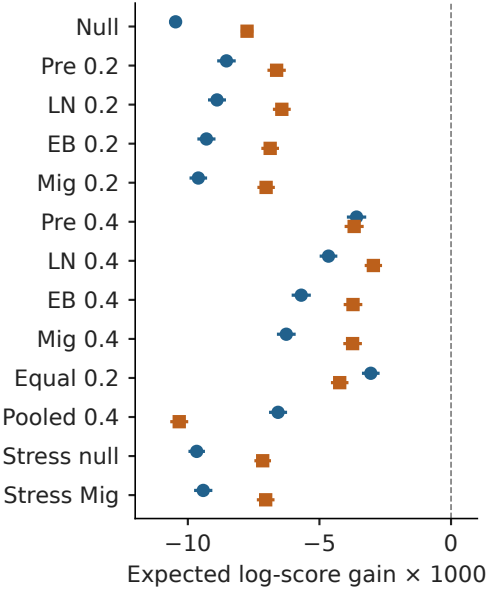
a **Chronological discrimination**



Injected contrast = 0.4; 400 datasets per condition.
Intervals are 95% Wilson intervals.
Zero wrong-period nominations in these conditions does not imply high power to identify the correct one.

b **Predictive performance**



Four-period model versus
● geography ■ pooled archaeology
Bars: ±1.96 Monte Carlo SE.
Negative values favour the simpler model.

Benchmarks assess fixed designs; they do not calibrate profile selection or establish a historical mechanism.
